Minimum Spanning Tree

Minimum Spanning Tree

- Problem: given a connected, undirected, weighted graph:

Minimum Spanning Tree

- Problem: given a connected, undirected, weighted graph, find a *spanning tree* using edges that **minimize** the total weight

Minimum Spanning Tree

- Which edges form the minimum spanning tree (MST) of the graph as shown below?

Minimum Spanning Tree

- Answer:

Minimum Spanning Tree

- MSTs satisfy the *optimal substructure property*: an optimal minimum spanning tree is composed of optimal minimum spanning subtrees
 - Let T be an MST of G with an edge (u, v) in the middle
 - Removing (u, v) partitions T into two trees T_1 and T_2
 - Claim: T_1 is an MST of $G_1 = (V_1, E_1)$, and T_2 is an MST of $G_2 = (V_2, E_2)$
(Do V_1 and V_2 share vertices? Why?)
 - Proof: $w(T) = w(u, v) + w(T_1) + w(T_2)$
(There can't be a better tree than T_1 or T_2 . Then T would be suboptimal)
